VIRTUAL CAMPUS

HUMAN ANATOMY *atlas*

FOUR STEPS TO ACCESS DIGITAL CONTENTS

- 1 CONNECT** Go to the website indicated on the label that includes the access code
- 2 REGISTER** Register (first time only) to receive a username and password
- 3 ACCESS** Enter your username and password to access the restricted contents
- 4 TYPE THE CODE** Type in the personal access code hidden under the protection of the label applied to this page

After the first access, digital contents will be available on the website entering your username and password.

The **online access** grants **personal license** limited to a **single user** for each code.
The **access is limited to the individual user** and is not a library or institutional access license.

Sharing of passwords and/or code is not allowed; any misuse of the personal code will invalidate and lock it. The access cannot be shared and will expire according as indicated in the license agreement subscribed at the first access. Further details may be provided upon acceptance of the license agreement. The use of the code is subject to acceptance of the conditions. Any violation or attempted violation of code protection will not be accepted.

Hardware and software requirements:

PC with Windows, Macintosh or Linux,
latest generation of internet browser such as Internet Explorer (version 9 onwards), Firefox, Chrome etc.; Internet connection.

Technical Help Desk: by email at support@ediermes.com

To remove the protection
use a coin to scrape
with light pressure

**To access
the Virtual Campus digital area,
follow the instructions at the page

Consult
the e-book text

Digital edition of the books

The digital edition of the book allows you to read wherever you are, on multiple devices (tablet, computer or with a simple web browser), also when you are offline, personalizing your learning through useful interactive tools. The “fluid” format version gives the opportunity to change the body text size; in addition, the text can be read by the system device.

HUMAN ANATOMY

Atlas

Digital Edition

edi-ermes

HUMAN ANATOMY - ATLAS - Giuseppe Anastasi, Eugenio Gaudio, Carlo Tacchetti (eds)
Estomih Mtui (ed English edition)

Contributors to the three-volume edition and to the digital work of the overall Human Anatomy project:
Giuseppe Anastasi (University of Messina), Paolo Castano[†] (University Vita-Salute San Raffaele, Milan), Sergio Castorina (University of Catania), Ottavio Cremona (University Vita-Salute San Raffaele, Milan), Raffaele De Caro (University of Padova), Eugenio Gaudio (University of Roma - Sapienza), Guido Macchiarelli (University of L'Aquila), Mario Rende (University of Perugia), Domenico Ribatti (University of Bari), Chiarella Sforza (University of Milan), Carlo Tacchetti (University Vita-Salute San Raffaele, Milan)

Demetrio Milardi (University of Messina) has contributed to the realization of the 3D volume rendering images present in the Atlas and in the web platform

Digital resources: Angelo Favalaro (University of Messina), Antonio Esposito (University Vita-Salute San Raffaele, Milan), Maurizio Vertemati (University of Milan)

Copyright © 2019 Edi.Ermes s.r.l. - Milan (Italy)

ISBN 978-88-7051-596-1 (Print Edition)

ISBN 978-88-7051-597-8 (Digital Edition)

All literary and artistic rights reserved. All rights of translation, electronic storage, reproduction and adaptation of the whole text or any part thereof by any means (including microfilm and photostat duplication) are reserved for all countries.

A book is the final product of a very complex series of operations that requires numerous tests on texts and images. It is almost impossible to publish a book with no errors. We will be grateful to those who find them and notify us. For enquiries or suggestions about this volume, please use the following address:

Preface

The study of Human Anatomy requires significant theoretical learning coupled with an indispensable visual and manual contact with the human body. In theoretical learning, graphic representations play an important role in rendering the comprehension more immediate with respect to verbal description, notwithstanding its elaborate detail. Hence, the common need on the part of teachers and students to have clear and explanatory images – teachers for their lessons and students for their personal study. Ever since the beginning of the study of Human Anatomy – with the drawings of Leonardo da Vinci and Andreas Vesalius – anatomic illustration has always been an indispensable tool used alongside dissection to show students the topographic reality of organs and systems.

Andreae Vesalii, *Suorum de humani corporis fabrica librorum epitome*, Londini 1545
(courtesy of the Department of Experimental Medicine, Section of Human Anatomy, University of Genoa)

In the last few years, technological progress has enabled computer graphics, image post-processing methods and diagnostic imaging technologies to attain levels of detail and resolution unimaginable even just a decade ago. Combining these approaches, it is now possible to obtain extraordinarily realistic two- and three-dimensional anatomic representations of the living human body. And, with the aid of invasive diagnostic

Exemplificative images
from the Atlas of Human Anatomy

techniques (e.g. endoscopy, laparoscopy or thoracoscopy), one can also accompany these with images and videos of high anatomic quality and comprehensibility.

Thus the study of Human Anatomy on the cadaver can profit and gain from that based on the living human body, i.e. what the future doctors and health professionals will eventually be dealing with.

Based on these considerations we have created an innovative Atlas composed of an amply illustrated text and of a web area rich in original contents, in which both Anatomy as studied on the cadaver and Anatomy of the living human body find their place within a coordinated, organized framework.

The print version of the Atlas is organized on a regional and topographic basis. Each chapter is illustrated with the aid of:

- accurately executed and didactically useful drawings
- stratigraphic sequences that allow the reader, page by page, to reconstruct the organization of the various anatomic regions
- realistic CT or MR images of the living human body, elaborated with a program of three-dimensional volume rendering
- photographs of laparoscopic and endoscopic examinations.

The “*Virtual Campus*” web platform gathers together a vast catalogue of didactic material that is immediately accessible to the user thanks to its innovative organization with respect to the general world of Anatomy atlases. Each resource proposed is clearly framed within its area of reference; in addition, to shorten research times, the user can take advantage of interactive guided courses that provide full-fledged descriptions of anatomic areas presented in the format of a frontal lesson.

Contents of the web platform include:

- video lectures of Topographic Anatomy guide the user through resources related to the specific topic, by means of links becoming available when required
- interactive 3D reconstructions of CT or MR examinations of single organs or regions
- commented videos of laparoscopies and endoscopies
- commented videos of anatomic dissections on cadavers
- interactive stratigraphic animations.

Our aim with this work was to create a useful instrument both for students and teachers: as a tool for students in the study of anatomy and an indispensable companion throughout the whole course of their studies leading to graduation; and as an aid for teachers in the preparation of their own lessons.

But not only: it is now statistically proven that the knowledge of Anatomy acquired in the course of studies tends to diminish over time, and so needs to be updated constantly. Hence, this Atlas is also addressed to health professionals as a valid tool of consultation for updating their knowledge.

The particular development of some parts - that may appear to be highly specialized - makes this Atlas suitable for students and health professionals not only in the area of Medicine and Surgery, but also in the areas of Physiotherapy, Nursing Sciences, Motor Sciences, Dentistry and for all health professional courses.

This compact edition, although with fewer illustrations and a limited reorganization, covers exhaustively all parts of the human body, with the same attention to details given to the three-volume version, and offering, especially by the students, an easier and handy consultation.

We feel the need to express a sincere and heartfelt gratitude to the Publisher’s staff, for the great professionalism and enthusiasm demonstrated in the realization of this work alongside all of us.

We also extend our thanks to all those – colleagues, scientists, teachers and assistants – who have helped us with their advice, materials and critical review, stimulating us to bring to reality a milestone in the international panorama of publishing.

the Editors and the Contributors

Constituent Elements of the Atlas

The Atlas deals with the organization of the human body through various means of displaying the complex structures composing it.

Schematic Representations

Simple and immediate summary diagrams present the distribution and drainage pathways of arteries, veins, and lymphatic vessels in a concise and explanatory manner.

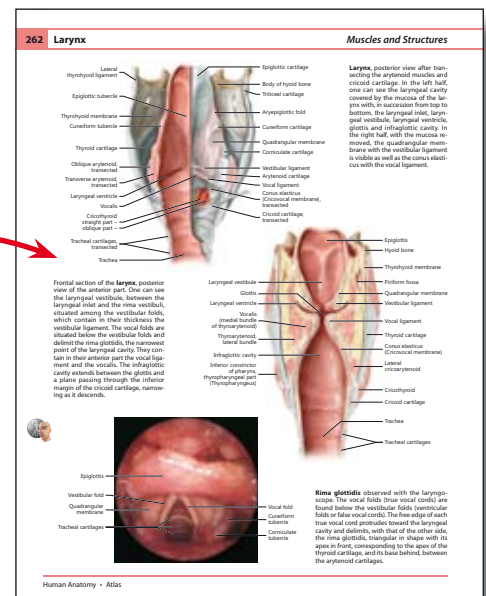

Traditional Pictorial Illustrations

Traditional, top notch iconography with color drawings, masterfully made specifically for this work, basic teaching aids accompanied by extensive explanatory captions.

Live Endoscopic Images

Images obtained during diagnostic examinations of thoracoscopy, laparoscopy, and endoscopy provide details of the anatomy of the living. The images are taken from videos entirely available as digital subsidies on the web platform associated with the Atlas.

Live Three-dimensional Images

The three-dimensional images of the living obtained with 3D volume rendering technique, of CT or MR image sequences help to understand the most refined anatomic details. Stratigraphic sequences and interactive 3D reconstructions are present in the Atlas web platform.

The reader, either a student or a professional, will have access to anatomic images – derived from cadavers, pictorial or obtained from a living human subject, through the use of diagnostic imaging techniques such as NMR or CT, viewed from diverse angles, or projections. In particular, except in the case of particular visualizations which are otherwise indicated, images on a transverse plane obtained with diagnostic imaging techniques are always presented according to a conventional projection from below, with the subject placed in supine position. In contrast, anatomic pictorial images or representations are presented according to a projection from above.

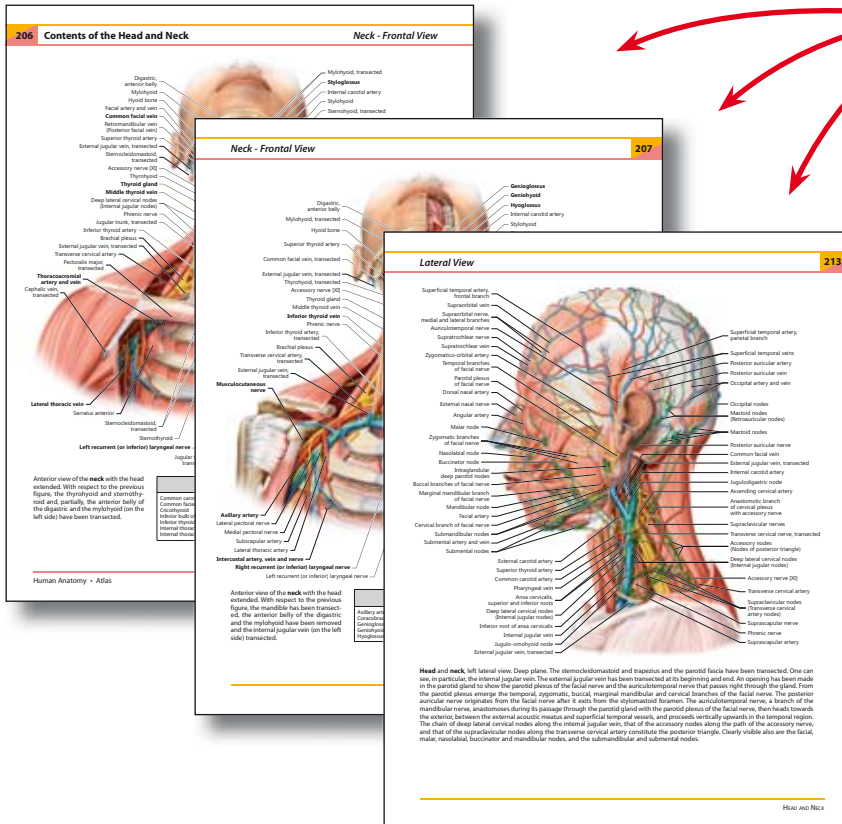

Summary Tables

Numerous tables summarize the boundaries and content of anatomical regions, arteries, veins, nerves, lymph nodes, muscles, joints, and bones, providing and organizing the most relevant information for each item schematically.

[illegible]

Diagrams Provide Examples of Nerve Plexuses

The organization of the nerve plexuses, sensory, and motor pathways is presented with effective summary patterns that accompany the most complex anatomical drawings.

Frontal and Lateral Slider

A sequence of drawings allow the student to study the contents of the cavities or the organization of anatomical regions with a stratigraphic multidimensional approach on frontal planes, sagittal planes or successive transverse planes. The different anatomical structures seen in each cavity or region are overlapped and added progressively. Sliders are available in the interactive form in the web platform associated with the Atlas.

Physiological and Clinical Indications

Physiological and clinical aspects and references were incorporated in order to illustrate the anatomical basics in a logical manner.

Elements of Biomechanics

Drawings, diagrams, and tables facilitate understanding and memorization of bones, joints, and muscular complexes and joint dynamics.

Summary of the Muscles of the Auditory Ossicles					
MUSCLE	ORIGIN	INSERTION	FIXATION	ACTION	OBSERVATIONS
Superior	Forward eminence of the external wall of the tympanic cavity	Posterior part of the head of the malleus	Facial nerve (CN V)	Retraction of the head of the malleus resulting in a slight tilt of the base of the malleus and a consequent reduction in the tension of the tympanic membrane	The smallest skeletal muscle of the human body
Tensor tympani	Body of the malleus	Posterior part of the head of the malleus	Stapedius (CN V)	Medial movement of the head of the malleus resulting in a tension of the tympanic membrane	

Functional anatomy
The auditory ossicles is a very efficient system for transmitting sounds from the external ear to the internal ear. The tympanic membrane, when vibrating, transmits the movement to the malleus, which in turn transmits it to the incus, and from the incus to the stapes. If the tympanic membrane moves medially towards the tympanic cavity, the same occurs for the stapes which moves deeper in the oval window; when the tympanic membrane moves laterally towards the external acoustic meatus, the stapes follows. The movements of the stapes are transmitted from its base to the perilymph of the vestibule. The axis of the swinging movements of the auditory ossicles is a direct horizontal line in the anteroposterior direction from the petrotympanic fissure to the base of the incus, passing through the anterior process of the malleus and the short apophysis of the incus. Sound waves also enter the internal ear by vibration of the air contained in the tympanic cavity or by vibrations in the entire bone formation surrounding the cochlea.

Mechanism of action of the stapedius.

Transmission mechanisms mediated by the auditory ossicles.

a. Fibrocartilaginous part of the pharyngotympanic tube in an oblique section conducted near the pharyngeal opening. It shows the characteristic crooked shape of the cartilage of the tube. **b.** Fibrocartilaginous part of the pharyngotympanic tube in conditions of patency determined by the contraction of the tensor vel palatini.

Thalamus - Conformation	756	Bone Conformation	791
Thalamus - Relationships	757	Bony Labyrinth	794
Nuclei of the Thalamus and Metathalamus	758	Vestibular System	
Hypothalamus - Conformation	761	Structural Organization	795
Hypothalamus - Connections	762	Semicircular Canals	796
Pituitary Gland	763	Vestibulo-ocular Reflex	797
Subthalamus, Epithalamus and Epithalamic Circuits	765	Lateral Vestibulospinal Tract	798
Telencephalon		Medial Vestibulospinal Tract	799
Conformation	766	Auditory System	
Cerebral Cortex	768	Internal Ear	800
Brodmann Areas	770	Spiral Organ	801
Ventricular Cavities	773	Central Auditory Pathways	802
Basal Nuclei - Positions and Relations	774	Visual System	
Basal Nuclei - Circuits	775	Eyeball	803
Insula	776	Retina	807
Clastrum	777	Retinal Cells	808
White Matter, Association Bundles and Capsule System	778	Transduction and Transmission of the Visual Signal	809
Corpus Callosum - Conformation	779	Visual Pathways	810
Corpus Callosum - Circuits	780	Miosis and Mydriasis	811
Fornix	781	INDEX	813

Anterior view of the **neck** with the head extended. With respect to the previous figure, the mandible has been transected, the anterior belly of the digastric and the mylohyoid have been removed and the internal jugular vein (on the left side) transected.

CONTENTS OF THE HEAD AND NECK (in bold are the structures added with respect to the preceding figure)		
Axillary artery Coracobrachialis Genioglossus Geniohyoid Hyoglossus	Inferior thyroid vein Intercostal artery Intercostal nerve Intercostal vein Musculocutaneous nerve	Right recurrent (or inferior) laryngeal nerve Thyroid cartilage

Sublingual sulcus. Transverse section of the head passing through the oral fissure. The tongue raised backwards shows the sublingual sulcus. On the right side, where the mucosa is intact, the veins of the submucosa can be seen showing through. On the left, the mucosa has been removed, and one can see affluents of the lingual vein and branches of the deep lingual artery. In addition, in the sublingual sulcus, the orifices where the ducts of the submandibular and sublingual glands open into the sulcus are visible.

Arterial blood supply and innervation of the **hard palate**, soft palate and palatoglossal arch, visible after removal of the mucosa. Evident also are the muscles of the **soft palate**.

Heart in situ. Frontal section passing through the **aortic valve**. The region in the box corresponds to the area highlighted in the figure below.

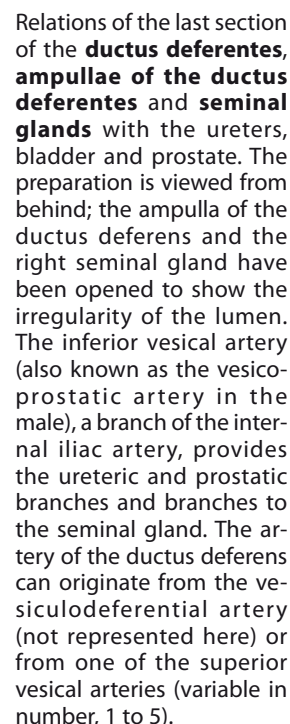

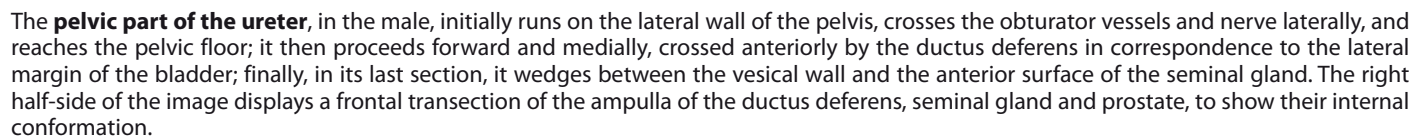

Three-dimensional image of a living human body, obtained by CT scan using a 3D volume rendering technique, showing the atrial and ventricular cavities, ascending aorta, pulmonary trunk and bronchial tree. Inside the box, the **aortic valve** is visible.

The **posterior vagal trunk** consists mainly of vagal fibers of the right vagus nerve. It gives origin to the posterior gastric branches, homologous to the anterior gastric branches of the anterior vagal trunk. The last and largest posterior gastric branch is termed the posterior nerve of the lesser curvature. The posterior vagal trunk also gives origin to a celiac branch; one of its poles reaches the right celiac ganglion, while the other one receives the right greater splanchnic nerve. This particular formation is known as *ansa memorabilis*, or *Wrisberg's ansa*.

Three-dimensional image of a living human body, obtained by CT scan using a 3D volume rendering technique, showing the **abdominal organs** in a transverse section passing through the eleventh thoracic vertebra.

Hand, frontal (palmar) view. The **median nerve**, runs in the carpal tunnel, between the tendinous sheath of the flexor pollicis longus and the tendinous sheath of the flexor digitorum profundus, and ends in its terminal branches in the palm of the hand: the **recurrent branch of the median nerve** (or nerve of thenar eminence) and the **common and proper palmar digital nerves** (of the thumb, of the index finger, of the middle finger and of the ring finger). From the superficial palmar branch of the ulnar nerve originate the **common palmar nerves** (one for the little finger, the other for the little finger and the ring finger), from which originate the **proper palmar digital nerves** (of the little finger and the ring finger).

Hand, frontal (palmar) view. The deep branch of the **ulnar nerve**, a prevalently motor nerve, runs deeper into the palm of the hand, together with the deep palmar branch of the **ulnar artery**, following the three central metacarpals, and forming an arch, concave laterally and superiorly, where numerous muscular branches originate.

The cerebellum is involved in the construction of the motor gesture acting on the lower motor neuron through the **vestibulocerebellum circuits** (I **Nervous System and Sense Organs**, Vestibular System, Lateral and Medial Vestibulo-spinal Tracts) and through the **paleocerebellum circuits** (II **Nervous System and Sense Organs**, Brainstem, Reticospinal Tracts - Medial and Lateral - and Rubrospinal); it also acts on the upper motor neuron through the neocerebellum circuit (*blue*) (III **Nervous System and Sense Organs**, Neocerebellum Circuit, next page). In particular, in the cooperation between the cerebral cortex and the cerebellar cortex, the **olive** plays a key role, both in learning the parameters that characterize the specific motor action (*green*) and in memorizing the same parameters (*red*).

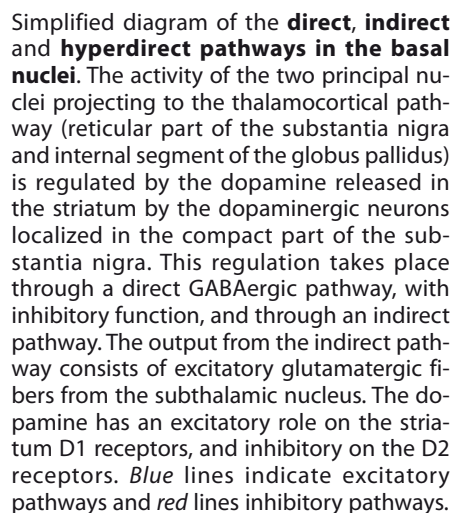

Olive (acquisition of motor parameters) (green in the graphs)	
Afferences	From the primary motor (MI) and premotor (PM) areas of the cerebral cortex and from the laminae VI and VII of the spinal cord to the olive
Efferences	From the olive to the entire cerebellar cortex (archi-, paleo- and neocerebellum)

Olive (memorization of motor parameters) (red in the graphs)*	
Neuron I	From the olive to the cerebellar cortex
Neuron II	From the nuclei of the cerebellum and, in particular, from the dentate nucleus to the parvocellular part of the red nucleus (neurubro)
Neuron III	From the neurubro to the olive

* The order in roman numbers of the three neurons is only virtual because it is a closed circuit that is repeated until the parameters change and new parameters are acquired.
